

Home Energy Checklist

The following is a simple checklist of energy conservation measures to use at home.

Today

- Turn down the temperature of your water heater to the warm setting (120°F). You'll save energy and avoid scalding your hands.
- Check if your water heater has an insulating blanket. An insulating blanket will pay for itself in one year or less!
- Heating can account for almost half of the average family's winter energy bill. Make sure your furnace or heat pump receives professional maintenance each year. And look for the ENERGY STAR® label when replacing your system.
- Review additional strategies to reduce your water heating bills. Water heating can account for 14%-25% of the energy consumed in your home.
- Survey your incandescent lights for opportunities to replace them with compact fluorescent lights (CFLs) or light-emitting diodes (LEDs). CFLs can save three-quarters of the electricity used by incandescents. The best targets are 60-100 W bulbs used several hours a day.
- Turn off the lights** in unoccupied rooms or consider installing timers, photo cells, or occupancy sensors to reduce the amount of time your lights are on.
- Turn off your computer monitor** when not in use for more than 20 minutes, and turn off both the CPU and monitor if you're not going to use your computer for more than 2 hours.
- Unplug equipment** that drains energy when not in use (i.e. cell phone chargers, fans, coffeemakers, desktop printers, radios, etc.).
- Install a **programmable thermostat** that can be adjusted to temperatures according to your schedule. And look for the ENERGY STAR® label when replacing your system.
- During winter, open curtains on your south-facing windows during the day to allow sunlight to naturally heat your home, and close them at night to reduce the chill you may feel from cold windows.
- Clean or replace filters** in your furnace, air conditioner, and heat pump.
- ENERGY STAR labeled products** can cut your energy bills by up to 30%. Find retailers near you at <http://www.energystar.gov/>.

This Week

- Visit the hardware store. Buy a water-heater blanket, low-flow showerheads, faucet aerators, and CFLs, as needed. If you can't find CFLs locally, check out ENERGY guide or Energy Federation Incorporated.
- Rope caulk or add film** to leaky windows.
- Assess your heating and cooling systems. Determine if replacements are justified, or whether you should retrofit them to work more efficiently to provide the same comfort (or better) for less energy.

This Month

- Collect your utility bills.** Separate electricity and fuel bills. Target the largest energy consumer or the largest bill for energy conservation measures.
- Insulate your hot water pipes** to prevent heat loss.
- Insulate heating ducts in unheated areas**, such as attics and crawlspaces. Keeping ducts in good repair can prevent heat loss of up to 60% at the registers.
- Seal up the largest air leaks** in your house—the ones that whistle on windy days, or feel drafty. The worst culprits are usually not windows and doors, but utility cut-throughs for pipes ("plumbing penetrations"), gaps around chimneys and recessed lights in insulated ceilings, and unfinished spaces behind cupboards and closets. Better yet, hire an energy auditor with a blower door to point out the worst cracks. All the little, invisible cracks and holes may add up to as much as an open window or door without you ever knowing it!
- Install a **programmable thermostat** to set your thermostat back automatically at night.
- Schedule an **energy audit** (ask your utility company or state energy office) for more expert advice on your home as a whole.

This Year

- Insulate.** If your walls aren't insulated have an insulation contractor blow cellulose into the walls. Bring your attic insulation level up to snuff.
- Replace aging, inefficient appliances.** Even if the appliance has a few useful years left, replacing it with a top-efficiency model is generally a good investment. Especially check the age and condition of your refrigerator.

- Upgrade leaky windows.** It may be time to replace them with energy-efficient models or to boost their efficiency with weatherstripping and storm windows. The typical home loses more than 25% of its heat through windows.
- Upgrade your computer and monitor.** Consider replacing your desktop computer with a laptop computer and docking station, and your cathode ray tube (CRT) monitor with a liquid crystal display (LCD) or LED monitor.
- Reduce your air conditioning costs by **planting shade trees and shrubs** around your house- especially on the west side.
- Know that you are making a difference!

These tips were taken from the *Consumer Guide to Home Energy Savings*
<http://www.aceee.org/consumer> For additional information on home energy conservation/efficiency measures, visit the Consumer Energy Center
